BROWN'S SERVO FLEX FEED SYSTEM

Beaverton, MI -- The new Servo Flex Feed from Brown provides close-tolerance accuracy and virtually infinite product placement flexibility. The Servo-powered pusher system allows maximum acceleration, deceleration and length of travel, providing precise repeatability of product placement. This is accomplished simply by changing the parameters at the operator interface.

An advanced cage design makes the Servo Flex Feed the easiest to operate and most versatile of its type in the industry. The sheet guides are optimally positioned during either the set-up or run modes. During production the guides are in a closed position to capture the formed web. By activating a pneumatic cylinder the sheet guides open, allowing for sheet guide adjustment, or easy web removal during set up. The front and back sheet guide fingers are mounted on scaled treadle bars for easy adjustment, left to right. Adjustment or removal of individual sheet guide fingers, as well as the complete treadle assembly, is easily accomplished without any need for tools. The Servo Flex Feed is available on all new Brown T-series equipment, and is may be retrofitted on most existing T-series machines.
